THE OFFICE OF REGULATORY STAFF DIRECT TESTIMONY

OF

DR. DOUGLAS H. CARLISLE

JUNE 8, 2010

DOCKET NO. 2009-473-WS

Application of Tega Cay Water Service, Incorporated for Adjustment of Rates and Charges June 8, 2010 Page 1 of 22

1		DIRECT TESTIMONY OF DR. DOUGLAS H. CARLISLE
2		FOR
3		THE OFFICE OF REGULATORY STAFF
4		DOCKET NO. 2009-473-WS
5	IN	RE: APPLICATION OF TEGA CAY WATER SERVICE FOR ADJUSTMENT OF
6		RATES AND CHARGES
7		
8	Q.	PLEASE STATE YOUR NAME, OCCUPATION AND BUSINESS ADDRESS.
9	A.	My name is Dr. Douglas H. Carlisle, Jr. I am an Economist at the South Carolina
10		Office of Regulatory Staff ("ORS"). My business address is 1401 Main Street, Suite 900,
11		Columbia, South Carolina 29201.
12	Q.	WOULD YOU PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND
13		YOUR BUSINESS EXPERIENCE?
14	A.	I received a Bachelor of Arts from Brown University, a Masters Degree in Public
15		Administration from the University of Virginia, and a Ph.D. in Government and
16		International Relations also from the University of Virginia. After graduate school, I
17		worked as an evaluator and evaluator-in-charge for 71/2 years at the United States
18		Government Accountability Office in Washington, D.C. Afterwards I worked as a
19		market consultant and instructor at Midlands Technical College in South Carolina. I
20		began work for the State at the State Reorganization Commission, which functioned as an
21		audit follow-up entity. I was next employed by the South Carolina House Education &

THE OFFICE OF REGULATORY STAFF 1401 Main Street, Suite 900 Columbia, SC 29201

26

Page 2 of 22

1		Public Works Committee. Before joining ORS, I worked five years for the State Chief
2		Economist as an analyst in the Economic Research Section, which serves as an adjunct to
3		the Board of Economic Advisors. I assumed my current position at ORS in March of
4		2005. I am a Certified Rate of Return Analyst and a member of the board of the Society
5		of Utility Regulatory Financial Analysts. I have previously testified before this
6		Commission concerning rate of return.
7	Q.	WHAT IS THE MISSION OF THE OFFICE OF REGULATORY STAFF?
8	A.	The mission of ORS is to represent the public interest in utility regulation by
9		balancing the concerns of the using and consuming public, the financial integrity of
10		public utilities, and the economic development of South Carolina.
11	Q.	WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?
12	A.	My purpose is to recommend the appropriate range for return on equity for Tega
13		Cay Water Service, Inc. ("Tega Cay" or "the Company"). I shall present my conclusions
14		and their basis for the appropriate return on equity for Tega Cay.
15	Q.	WHAT STANDARDS GOVERN RATE OF RETURN?
16	A.	The Supreme Court of the United States set standards in two landmark decisions.
17		In the first case, involving a water company, the Court declared:
18		
19 20 21 22 23 24 25		A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly

The return should be

profitable or speculative ventures.

D.	1	C	20
Page	•	OT	2.

1 2 3 4 5		reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise money for the proper discharge of its duties. ¹
6		This decision, the Bluefield decision, was later reinforced by the decision in
7		another case, Federal Power Commission v. Hope Natural Gas Company:
8		
9 10 11 12 13 14 15 16 17 18		[T]he fixing of "just and reasonable" rates, involves a balancing of the investor and consumer interests From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital cost of the business. These include service on the debt and dividends on the stock By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and attract capital. ²
20		Decades later, a Supreme Court decision, the Permian Basin Area Rate Cases,3
21		stressed that factors other than producers' costs are important in the regulation of public
22		utilities and, for that reason, regulation may reasonably "limit stringently the return
23		recovered on investment," so long as the effect is not to destroy the utility.
24	Q.	DOES TEGA CAY HAVE TRADED COMMON STOCK?
25	A.	No, its stock is entirely held by Utilities, Inc. of Northbrook, Illinois, which also
26		has no publicly traded stock. Utilities, Inc. was bought by AIG Highstar's sponsored
27		fund Hydro Star, LLC, in 2006.

¹ Bluefield Water Works & Improvement Company. v. Public Service Commission of West Virginia, 262 U.S. 679, 692-3 (1923).

² Federal Power Commission v. Hope Natural Gas Company, 320 U.S. 591, 603 (1944).

³ 390 U.S. 747 (1968).

June 8, 2010 Page 4 of 22

Q. IF NEITHER THE COMPANY NOR ITS PARENT HAS TRADED STOCK, HOW

DID YOU PERFORM YOUR ANALYSIS TO RECOMMEND A RETURN ON

EOUITY?

1

20

21

22

A.

A.

A. To develop a fair rate of return recommendation for Tega Cay, I evaluated the return requirements of investors on the common stock of publicly-held water service companies. I then applied two well-known and generally accepted methods for determining a recommended return on equity, the Discounted Cash Flow ("DCF") and Capital Asset Pricing ("CAP-M") methods. As a corroborative method, I also used the Comparable Earnings Method ("CEM").

Q. WHY DID YOU EXAMINE DATA ON COMPANIES WITH TRADED STOCK?

First, Tega Cay has asked to be treated as a publicly traded company by applying for a rate-based return-on-equity proceeding with the Public Service Commission of South Carolina ("PSC" or "Commission"). Second, publicly traded water utilities are in the same line of business as Tega Cay and so share similar risks, which conforms to the criteria in the *Bluefield* and *Hope* cases. Third, data is far more readily available about publicly traded companies, so it is practical to use them.

Q. WHAT CAPITAL STRUCTURE DID YOU USE FOR YOUR ANALYSIS OF

TEGA CAY?

I used the structure submitted by the Company and provided to ORS: 53.3% debt, with a cost rate of 6.58%, and 46.7% equity, whose cost rate is the subject of this testimony. I used this structure for two reasons: Tega Cay is closely integrated with its parent, so it would be difficult to determine an independently based capital structure. I

A.

Page 5 of 22

used only Long-Term Debt and Common Equity and did not consider Short-Term Debt for several reasons: (1) the Company's proposed hypothetical structure, based on its parent's, uses those items; (2) those items and proportions appear reasonable because the equity proportion is close to the average of publicly traded water companies (Exhibit DHC-2); (3) it has been the practice before the Commission for a number of years to use Common Equity, Preferred Stock, if any, and Long-Term Debt. There was no Preferred Stock. (Exhibit DHC-1)

Q. DID YOU CONSIDER THE ECONOMIC CONTEXT OF YOUR ANALYSIS?

Yes. There are two major impacts of the current economic situations that directly affect my analysis: interest rates and inflation. Additionally, there is always the consideration of the current economic cycle.

A large question right now is whether current monetary policy will eventually trigger inflation. It would appear logical that the Federal Reserve's policies during this recession have lowered interest rates and could raise inflation during recovery, but whether the interest rate effect is a major one for companies that borrow and whether the result will be sharper inflation are uncertain. (Exhibit DHC-3 & DHC-3a, for discussions of the advent of this recession and current monetary policy.) The Federal Reserve, moreover, has ended some of its extraordinary measures. (Exhibit DHC-3, page3 of 3) Inflation is quiescent and signals from the Federal Reserve indicate that it is likely to remain so for some time. The Federal Reserve's termination of its special lending facilities withdraws one source of excess money. Unemployment and the number of discouraged workers not even counted in the unemployment numbers are dampening

A.

Page 6 of 22

inflationary tendencies (Exhibit DHC-17). Moreover, consumers have paid down some of their debt (Exhibit DHC-5, page 3 of 3), and other sectors have reduced their debt as well (Exhibit DHC-5, p. 3 of 3). A number of professional forecasters believe that inflation will remain muted. (Exhibit DHC-6) Still another source of potential inflation, the surge in Federal expenditures, the "Stimulus," will mostly be spent down by the end of the calendar year, so its inflationary impact will diminish. Another non-inflationary process to consider is the slow recovery of the economy, as well as an indication that relatively few high earning stocks will squeeze lower-earning, more reliable stocks. Taken altogether, we see a general retreat of risk and a mild recovery.

If overall inflation is low and economic growth is measured, then it stands to reason that a steady-growth industry such as water and sewer service will not grow exceptionally fast nor face exceptional inflation. Moreover, recent data shows that utilities experienced slow growth or mild decline, rather than the sharp decline that has affected many sectors of our economy during the recession.

Q. HOW DO YOU KNOW THAT INFLATION WILL BE MILD?

No one can be absolutely certain what inflation will do, but indications from the Federal Reserve, whose monetary policy, among other things, seeks to control inflation, if it should threaten our economy, is sanguine about the near term. Debate centers on what will happen in a year or two or even longer.

More than opinions, however, are two major factors militating against inflation: private debt and persistently high unemployment. Personal, business and financial sector has declined debt considerably (See Exhibit DHC-17 p.3c of 3). The process of shedding

Page 7 of 22

debt, "deleveraging," may continue for quite some time. Money spent on eliminating
debt cannot be spent to purchase goods and create economic growth. Although
increasing governmental debt may "crowd out" private debt and raise interest rates, it is
likely that such a process would also slow growth and discourage inflation, which is part
of nominal growth as measured by both the DCF Model and CAP-M. The two Federal
Reserve officials most noted for their concern about inflation have both declared that
their concern is not immediate and one has even raised the possibility of deflation. In an
interview by Susie Gharib on the Public Broadcasting System's "Nightly Business
Report" Dallas Federal Reserve Bank President, Richard Fisher provided the following
analysis (italics added):
GHARIB: But how long can the Fed keep rates at 0 percent and not stir up inflation?
FISHER: Well, it depends on what the demand pull forces are, cost-push forces that come. I guess the real issue too is whether or not we keep rates this low, do we encourage speculative bubbles elsewhere? Some of my colleagues are worried about that.
GHARIB: Are you worried about that? Do you see them cropping up anywhere?
FISHER: I don't see it right now, but I think we have to always be vigilant on that front.
GHARIB: What do you think is the appropriate rate for inflation in the U.S. economy? Some economists are saying up to 3 percent, it's not a problem.
FISHER: I disagree with that. As you know, I'm one of the most hawkish members of the committee not because I come from Texas and we're hawkish people, but I think 1 percent, 1 to 2 percent max, because if you're not careful, things can get away from you. And there's been a recent

June 8, 2010 Page 8 of 22

1 academic paper which has said maybe we ought to target 4 or more. I 2 firmly disagree with that. 3 4 GHARIB: Do you see any inflation now? Are you worried about inflation 5 now? 6 7 FISHER: No, in fact we're seeing pressures that are in the opposite 8 direction. Part of it has to be with the entrails of the numbers, by the way. 9 Oddly, the last number that was reported, it was luggage that was one of 10 the most interesting, of all the variables, that drove this number to a very 11 negative territory -- not very negative, a slightly negative territory. There's 12 too much slack in the system right now and again, until we employ the 13 biggest factor, labor, until some of this excess capacity worldwide --14 which is gradually working off -- gets back into better demand 15 configuration, then I am not, even as a hawk on the committee, I am less worried about inflation in the short term. If we do our business well, then I 16 won't worry about the intermediate term or the long-term either.⁴ 17 18 19 The President of the Kansas City Federal Reserve Bank, Thomas Hoenig, who stresses 20 vigilance against inflation, perhaps even more than his Dallas counterpart, in an interview 21 on the same program a month earlier, revealed that he does not necessarily expect 22 inflation to occur right away (italics added): 23 24 GHARIB: So do you think that the Fed should begin signaling that it's 25 getting ready to raise interest rates? 26 27 HOENIG: No. What I'm saying is that the language should be changed so 28 that we're not tying ourselves to language that says we won't do anything 29 for an extended period when in fact events are changing, the economy is 30 strengthening. I think those are -- those are really what I'm trying to say

GHARIB: Well, if not zero, where should rates be? What is normal?

economy and with interest rates.

31

⁴ http://www.pbs.org/nbr/site/onair/transcripts/nbr_transcripts_100302/

June 8, 2010 Page 9 of 22

HOENIG: Well, in the long run, of course, I've said in public speeches, you need to have the policy rate at least higher than 3 percent, but now remember, that's a long time ahead. I said 3.5 to 4.5 in a very long period. So that's quarters or maybe even years ahead depending on how the economy recovery goes, but that's not something -- I don't want anyone to take away from this discussion that I think that should be the rate tomorrow.

A few seconds later, Hoenig stressed, "Remember, interest rates were very low in 2001, 2002 and the effects of that really came much later. And that's what we have to keep in mind for the future." Since Hoenig was the only current member of the Federal Open Market Committee to oppose the statement that rates would remain the same "for an extended period" and is optimistic about the pace of recovery, his statements indicate that even someone with his viewpoint is cautious about raising rates immediately and foresees inflationary pressures several years down the road. The very existence of the debate over whether growth and inflation will pose problems in the upcoming years demonstrates a heightened alertness among policymakers and a high likelihood of preventive action.

Q. DOES ECONOMIC GROWTH AFFECT WATER COMPANIES?

20 A. Yes. Most predictions are for a slow but steady recovery. A return to historical patterns would not be surprising. At the same time, there has been sufficient recovery that the flight to the safety of investing in utilities has probably ended.

Q. HOW DID YOU SELECT YOUR PROXY GROUP?

A. My Proxy Group consists of companies that are classified as "water utilities" by Value Line or by *Yahoo! Finance*. I did not include foreign companies, which, in any

⁵ Ibid.

⁶ Ibid. Fisher opposed it as an alternate member and will be a regular member in 2011.

Page 10 of 22

event, were largely engaged in overseas or water-purification activities. The proxy group companies engage in water or sewer service to customers and obtain most of their revenues from utility services, operate mainly in the United States, and have traded stock. I eliminated one company, Southwest Water Company, due to several serious problems with its accounting and record keeping which led to a restatement of its 10-Q filings with the Securities Exchange Commission, threatened delisting from NASDAQ and several law suits (Exhibit DHC-2, page 2 of 2). Although the Southwest Water Company may have resolved these issues, the extent of the financial restatement – back to 2005 – and the lingering possible effect on perceived risk indicate that it is not appropriate to include it in the Proxy Group. Two companies listed in *Yahoo! Finance* were eliminated because their business was not water service. This process produced the Proxy Group, which comprises 10 companies. (Exhibit DHC-2, page 1 of 2)

A.

Discounted Cash Flow Method (DCF) Analysis

Q. WHAT IS THE DISCOUNTED CASH FLOW METHOD ("DCF")?

The DCF is derived from the Dividend Discount Model, which treats the value of a company to an investor as the sum of the stream of expected dividend payments out to an infinite horizon. The DCF method is directly related to present value discounting, which is used to assess whether a given investment is better than alternative investments. Choosing among alternatives lies at the heart of economics, so a model that treats the investor as a consumer of investments fits well with economic thinking. Popularized by Myron Gordon, this model turns upon the estimation of long-term growth and combines

A.

June 8, 2010 Page 11 of 22

it with dividend yields to derive the cost of equity. That cost becomes the recommended return on equity for a firm that is generally similarly situated as those firms used in the DCF analysis.

Q. HOW DOES THE DCF PRODUCE A RECOMMENDED RETURN ON EQUITY?

A. It does so by assuming an infinite time horizon to simplify the calculation of the stream of dividend payments in the following equation:

$$K = DIV_1/P_0 + g$$

"K" is the cost of equity; "DIV" is the annualized dividend paid in the next period, but it can be adjusted to ensure it is a typical quarter; "P" is the price of the investment; and, "g" is the growth rate of the investment.

Q. HOW CAN THE PROPER RATE OF GROWTH BE DETERMINED?

This part of a DCF analysis poses the hardest question. One can tell what dividend yields are because there is always recent data on stock prices and dividend payments – although that aspect is not entirely straightforward – but predicting future growth is harder and more controversial. Pointers that can help, however, do exist. Widely available and well known historical statistics and estimates of Earnings Per Share ("EPS") are one predictor of dividend growth and dividends are paid from earnings, which, when retained, represent part of investors' equity. Logically prior to EPS is sales and earnings growth and subsequent to EPS is the growth of Dividends Per Share ("DPS"), which are usually paid from a portion of earnings. Finally, there is the growth in Book Value Per Share ("BVPS"), which is the value of the company after liabilities and the payment of preferred stock is subtracted from assets. For the model to hold true,

Page 12 of 22

these factors should grow at the same rate over time, although there may be substantial periods when they diverge. No one of these factors should dominate, because each reveals a different aspect of growth. Their interconnectedness makes the assumption of similar growth appeal to common sense. For example, if DPS were to increase faster than EPS, eventually there would be no funds for paying dividends. If BVPS grew more slowly for a long time, eventually there would be no means of producing sales or earnings.

Q. IF THESE FACTORS VARY IN THE SHORT RUN, ARE THEY REALLY

USEFUL?

Yes. They are, if one is careful to eliminate atypical results, to combine them all and not to rely on any one of them too heavily. While this process sounds challenging, it reflects what investors do: they are concerned about historical performance of the firms in which they want to invest as one indicator of future performance. The indicators of growth used in the DCF calculation are widely available through investor services. The very availability of this information indicates that investors want it, or firms would not provide it. Moreover, these different factors combine to create growth, so, even if any given investor does not know all of them, that investor is nonetheless aware of the overall influence of the factors in my analysis.

Q. ARE INVESTORS JUST INTERESTED IN HISTORICAL PATTERNS?

No. Investors' interest in firms' future performance does not just rely upon the past as a pointer to the future. Stock analysts provide predictions that are widely available, too. I have used both historical data and predictions to arrive at growth rates.

Page 13 of 22

June 8, 2010

Q. YOU MENTIONED THAT DIVIDENDS AND PRICES ARE "NOT ENTIRELY STRAIGHTFORWARD," SO ARE THERE OTHER IMPORTANT

CONSIDERATIONS IN THE DCF?

Yes. The two considerations are fair measurements of stock price and dividends. A simple solution to both is to use a dividend yield from an investment service or an information firm. For example, Value Line has a dividend yield statistic that it keeps. Greater precision is preferable, so I have used another source, which is three months' data from *Yahoo! Finance* (internet site; Exhibit DHC-11).

A fair measure of stock price requires some judgment. What makes this step easier is that the dividend yield should represent the latest information available to investors, so an extensive timeframe is not appropriate. That said, sometimes going back a few months in a period of volatility may be appropriate, since investors are probably aware of the volatility, too. An extensive retrospective look at stock prices, however, would make the data stale and unrepresentative of the latest information available to investors.

Measuring the dividend payment accuracy is more difficult because companies have different dividend declaration dates and some companies allow their dividends to fluctuate from quarter to quarter, which makes an accurate statement of a company's yield and comparison among firms harder to calculate. There is a potential undercounting, due to these factors alone, of 150% over three quarters, as indicated in the following table which is analyzes a hypothetical company:

A.

June 8, 2010 Page 14 of 22

Company Quarter	Quarters for which an increase would be counted	Potential Undercounting
First	4	$0.0 \text{ [because } 1 - \frac{4}{4} = 0]$
Second	3	$0.25 (\frac{1}{4}) $ [because $1 - \frac{3}{4} = \frac{1}{4}$]
Third	2	$0.50 (\frac{1}{2}) $ [because $1 - \frac{2}{4} = \frac{2}{4}$ or $\frac{1}{2}$]
Fourth	1	0.75 (3/4) [because $1 - 3/4 = 1/4$]
Total Undercounting over	r Three Quarters	1.5 (0.25+0.50+0.75) [1/4+2/4+3/4]
Undercounting per Quart	er	1.5/3=0.5

If increases occur after the next known declared dividend payment, each quarter's dividend will be more undercounted going forward because dividend payments are measured on a yearly basis. A dividend increase is assumed to be at the overall growth rate "g." An increase taking place in the first quarter's dividend would be counted for that quarter and the rest of the year, but subsequent increases would be counted for only part of the remaining year. Overall there is a potential undercounting of half of the total potential increases, so each quarter could be undercounted by one-half. To offset this potential undercounting, each quarter must be multiplied by half-again, that is, 150%, or, to achieve the same result, the dividend yield can be multiplied by ½ or 50% and added to the existing dividend yield. The formulas below depict these alternatives:

12
$$K = (DIV_1*(1+0.5g)) + g$$
13 Or

Q.

A.

Page 15 of 22

As the second formula shows, the dividend yield is multiplied by half the percentage growth rate and that additional increment is added to the yield and the growth rate to obtain the cost of equity (Exhibit DHC-14).

Because of the current recovery from the recession, a spot yield, while technically fair because it represents what an investor would face at a given point in time, is not as representative of yields, which are subject to some volatility during the recovery from the recession. To handle this fluctuation, I took three months of yields for each company and then a "spot" yield and averaged the two, as shown in Exhibit DHC-12.

DESCRIBE THE COMPONENTS OF THE DCF ANALYSIS.

The DCF analysis uses historical data and analysts' predictions to come up with a predicted growth rate for each company. Since both compounded and simple average growth rates, also known, respectively, as "geometric" and "arithmetic mean" rates, are available to investors, my analysis uses both growth rates. Next the adjusted dividend yield – the part of the equation left after "g" – is added to get a cost of equity for the proxy group. The result is my estimated cost of capital and my recommended return on equity.

To minimize too great an impact from any one year, I took three overlapping time periods of different lengths: three years; five years; and ten years. In this manner, even though the recession from which we are emerging has some influence on the numbers, so does the rebound from the previous recession of 2001.

The dividend yield measurement in this case coincides with a period of stock market recovery. As the prices of shares rise, dividend yields fall. Whether the recovery

A.

in stock prices will continue, flatten or even reverse cannot be known for certain, although the last possibility seems the least likely. What is clear is that, barring an increase in dividends, a fall in dividend yields is a mathematical certainty as a consequence of the trend of rising stock prices. Because companies may well wait to increase their dividends and we do not know if there will be a dip or sustained decline in stock prices, the period of measurement must balance all these possibilities. Accordingly, I have used an average of the last three months of 2009 and a "spot" dividend and then averaged these two numbers. For the dividend, I have used the latest four-quarter dividend payments. The use of the 1½ g (1.5*g) as a proxy for dividend growth keeps the dividend measurement prospective, while also offsetting any lag in dividend increases after stock prices have risen.

Q. DOES THE INCLUSION OF SHORT-TERM HISTORICAL DATA, WHICH INCLUDE THE ONSET OF THE RECESSION, BIAS YOUR RESULT?

No. It would be biased if the effects of the recession were excluded. It is possible that the short-term data could exaggerate water companies' collective growth rate, but the relatively slow recovery should temper that effect.

It is important to remember that the steadiness of the private water industry is attractive in times of recession, because the very nature of water as a good. There may be some conservation of water to save money, but it is nothing compared to cutbacks that people are likely to make in food, clothing and shelter. Of course, as investors hold back purchases of stock or even sell off share, dividend yield becomes more attractive, so total returns may go up, especially in the case of regulated utilities because their stock prices

A.

are unlikely to fall as much as more volatile businesses, so they get a slight increase in yield that does not come at the expenses of a large drop in stock. Moreover, a look at Exhibit DHC-14 reveals that each of the four factors used to measure growth went up at a faster rate in the last three years than in the last five years. In other words, the period that was dominated by recessionary years was a period of faster underlying growth than the period less dominated by the recession. Although including this data may tend to skew the results, using the longer-term 10-year data and dividend yields, especially the spot yield, offsets this tendency. It is notable that growth in 2009 turned out to be a distinctly lower for water companies and pulled down the historical growth rates. Investors are aware of this data and it doubtless contributes to their decisions.

Q. WHAT WAS THE RESULT OF YOUR DCF ANALYSIS?

12 A. The DCF Method indicates a 9.08% cost of equity. (Exhibit DHC-14)

Capital Asset Pricing Model (CAP-M) Analysis

14 Q. WHAT IS THE CAP-M?

CAP-M is a method of determining appropriate returns on equity based upon the market price of capital as measured by the risk specific to a company. This model assumes that investors can neutralize all other risk in the market by diversifying their holdings in a portfolio of companies with differing risks and returns. The remaining risk, specific to a company, is the degree to which a company's return varies from all other returns, usually measured against a stock index. The presumption that investors want to maximize returns from investments while minimizing the risks of investing underpins CAP-M.

June 8, 2010 Page 18 of 22

Q. HOW IS COMPANY-SPECIFIC RISK MEASURED?

A.

A.

There is a measurement of a stock's return compared to that of all other stocks called "Beta" (" β "). Under the CAP-M theory, one examines what an investor would be able to earn on a stock, if the market risk that it had in common with the whole investment market were neutralized. Different firms that analyze stocks produce different β 's for the same stock, so one must pick a single firm and use only its β 's for consistency's sake. In my analysis, I use the β 's provided by Value Line as they are both readily available and provide a reasonable representation of what a company's risk is now and will be in the easily foreseeable future. I averaged the β 's of all the water companies for which β was available in the two Groups (Exhibit DHC-15). This calculation produced an average β of .71.

Q. HOW IS MARKET RISK MEASURED?

Long-term trends provide the best answer. My source for retrospective data was Ibbotson Associates' annual yearbook, Stocks, Bonds, Bills & Inflation, Valuation Edition, 2009, which contains the total returns for the Standard & Poors 500 from 1926-2008. This annual publication provides the long-term compounded and simple arithmetic average returns for both large and small companies. The average of the large and small companies' averages gives the return for what is typical for publicly traded companies.

The long-term data presented by Ibbotson Associates assumes that investors could have held each stock in their database in a portfolio that removes risk idiosyncratic to each company, leaving only market risk with differential impact to each company (β). To do this, real portfolios would have to have been adjusted to maintain a balance of risk and

return. Thus this data represents long-term market trends. In that sense, the CAP-M is comparable to the DCF, which has an infinite time horizon, although there can be problems with assuming that the future will resemble the past.

4 O. HOW DOES THE CAP-M DIFFER MOST FROM THE DCF?

A. Although the use of β seems unique, the most essential difference is that the
 CAP-M belongs to the risk premium family of analysis.

7 Q. HOW DID YOU MEASURE THE RISK-FREE RATE IN THE CURRENT 8 ECONOMIC ENVIRONMENT?

The key to measuring the risk premium is finding a benchmark_ the risk-free rate. Typically, I would use 30-year Treasury bond yields as the risk-free rate. No investment of any kind is truly risk-free, but the safety of securities issued by the U.S. Treasury is such that, if they should ever come to be considered risky, then all other investments in the United States would become so risky that assessing risk would become futile. The 30-year Treasury bond yield represents purchasers' assessment of a risk-free return on a long-term investment.

The monetary environment during the recession that began in December 2007 created a situation of great uncertainty, as opposed to great risk. "Uncertainty" in this sense applies to a situation in which investors do not know how to assess the risk of certain investments. "Risk," in contra-distinction, applies to a situation in which investors feel reasonably confident in assigning a probability of achieving their investment goals.

Page 20 of 22

Recent decisions by the Federal Reserve (see Exhibit DHC-3) and the waning of extreme distrust among financial businesses (see Exhibit DHC-3a) have removed much of the uncertainty and returned us to the more usual situation of risk. For that reason I have used the 30-year Treasury Bond yield rate in the First Quarter of 2010 (see Exhibit DHC-6, p.1 of 2). This rate should reflect investors' long-term view of one of the most riskless forms of investment.

Q. HOW DID YOU MEASURE THE RISK PREMIUM COMPONENT?

- With the market-risk rate and the risk-free rates established, I have followed the standard formula for CAP-M by subtracting the latter from the former to get the market risk premium and then multiplied the result by the average β of the proxy group to apply the premium to the proxy group. Adding the risk-free rate back produces the CAP-M cost of equity and my recommended CAP-M return on equity. Here is the formula:
- 13 $K = R_f + (\beta * (R_f R_m))$
- 14 "K" is the cost of equity; "R_f" is the risk-free rate; and, "R_m" is the market rate.

 15 It is important to note that this calculation contained both arithmetic and geometric

 16 means/averages from the Ibbotson yearbook.

Comparable Earnings Method ("CEM")

19 Q. WHAT IS YOUR PURPOSE IN USING THE CEM?

- 20 A. I used this method to corroborate my other analyses.
- 21 Q. WHY DOES THE CEM METHOD HAVE THIS SUBORDINATE ROLE IN
- 22 **YOUR ANALYSIS?**

A.

Q.

A.

Page 21 of 22

For two reasons. The first reason is that the CEM, although grounded in legitimate theory, has no widely accepted single method. The second reason is the CEM may overstate returns by including low-risk firms that have done far less badly than higher risk firms. I have offset this second difficulty by relying exclusively on growth in book value, which is less subject to the vagaries of economic growth or interest rates.

HOW DID YOU PERFORM YOUR CEM ANALYSIS?

I used the well-known measurement of risk, β , and selected firms whose β 's over the past ten years averaged in the same range as those in my proxy group. I excluded firms in the financial, insurance and building sectors, since their issues are closely related to the economic problems recently experienced. I took the Value Line 10-year growth for book value, for a retrospective view of growth, and the Value Line projected book-value annual growth for a prospective view. I then averaged these two numbers, which resulted in a 9.18% growth rate. Presumably, this growth rate would eventually show up in dividends and sustainable growth. The result verifies and corroborates my other results. (Exhibit DHC-16)

Summary of Results

Q. WILL YOU SUMMARIZE THE RESULTS OF YOUR ANALYSIS OF TEGA CAY'S RETURN ON EQUITY?

A. My analysis of Tega Cay's rate of return on equity yields the following results: 1) the bottom of my range is 9.08% return on equity (see Exhibit DHC-14); 2) the top of my

6 Q. DOES THIS CONCLUDE YOUR TESTIMONY?

7 A. Yes.

A Review of Some Major Events of the Current Recession

A quick review of some the highlights of the events of the current recession illustrates how much this recession has been about finance. From March 14th to 16th of 2008, two of Bear Stearns' hedge funds with large holdings of subprime mortgages ran large losses and were forced to dump assets, leading to its sale of Bear Stearns to J. P. Morgan Chase. The trouble spread to major Wall Street firms such as Merrill Lynch, J. P. Morgan Chase, Citigroup and Goldman Sachs which had loaned money on the basis of assets that turned out to be worth less than thought. Falling prices of houses and equities reduced the wealth of households and created uncertainty about the economy. The S&P 500 Index fell as much as 50% during 2008 and housing prices fell 13% in the twelve-month run-up to the recession. A large number of banks and other financial institutions had balance sheets that were suddenly deemed untrustworthy because they reflected holdings of securities whose underlying value was tied to houses purchased with nontraditional mortgages. The best known example of the sudden collapse in trust is the bankruptcy of Lehman Brothers on September 15, 2008, the largest bankruptcy filing in U.S. history, with Lehman holding over \$600 billion in assets. ¹

When falling housing prices led to defaults and foreclosures, the value of corporate assets suffered. Moreover, some financial instruments, such as credit default swaps, greatly magnified the effects of declining value. Fannie Mae lost \$29 Billion on Write-Downs. The Federal Reserve announced that it planned to buy up \$600 billion in debt and mortgage-backed securities from Fannie Mae, Freddie Mac and Ginnie Mae, the three government-sponsored finance firms established to promote home ownership.

As a result of steep drops in the value of assets and a dramatic drop in the willingness to lend, the Federal Reserve began a series of cuts in the Federal Funds Rate, the rate at which it lends banks money,

¹ "Lehman folds with record \$613 billion debt". Marketwatch. 2008-09-15. http://www.marketwatch.com/news/story/story.aspx?guid={2FE5AC05-597A-4E71-A2D5-9B9FCC290520}&siteid=rss. Retrieved on 2008-09-15.

starting with a half percent cut to 5.75% on August 16, 2007 and culminating in a drop on December 16, 2008 to a range between 0.0% and 0.25%. On November 10, 2008, the US Treasury announced investment of 40 billion dollars in preferred stock of AIG. In the First Quarter of 2009, the Federal Reserve purchased \$1.25 trillion in mortgage-backed securities and \$200 billion in agency debt.

On March 18, the Federal Reserve announced plans to purchase up to \$300 billion of longer-term Treasury securities. On June 24, 2009, it reiterated its plans to buy Treasury securities. Because the Federal Reserve had set rates near zero already, it could not cut them much. If there were deflation, real interest rates would rise, so its latest move circumvented the limitations of interest-rate policy by injecting liquidity directly into the monetary system through a variety of devices but especially through special credit facilities.²

The Federal Reserve's special programs were designed to ease credit in the face of illiquidity arising from the credit crisis that was both cause and result of the recession. Two measures of illiquidity, the "TED Spread" and the "OIS-LIBOR Spread" had widened dramatically (see Exhibits DHC-3a, pp.2&5 of 5). This former is the difference between the Three-Month U.S. Treasury Bill rate and the London Interbank Offered Rate ("LIBOR"). The latter is the difference between the Overnight Indexed Swap ("OIS") and LIBOR (see Exhibit DHC-3a, pp.1-3 of 5). Both of these indicators shot up during the credit crisis, but in the past few months have returned to near-normal levels. As a result of the return to a more normal credit situation, the Federal Reserve has let some programs lapse and is moving to terminate others. The Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility, the Commercial Paper Funding Facility, the Primary Dealer Credit Facility, and the Term Securities Lending Facility were closed on February 1, 2010. Recently, on February 18, 2010, Chairman Benjamin Bernanke

² Most of the rest of the above discussion comes from these sources:

Federal Reserve Bank of St. Louis: January 2009 "Man the Lifeboats!" By Kevin L. Kliesen; and,

^{[&}quot;The Global Economic & Financial Crisis: A Timeline," Mauro F. Guillén Director of the Lauder Institute, Wharton School, University of Pennsylvania

³ It used to be the difference between the Euro-Dollar futures contract and the Three-Month U.S. Treasury Bill rate, thence the name "TED" ("Treasury/Eurodollar")

announced the planned closing of two more credit facilities: the Term Auction Facility and the Term Asset-Backed Securities Loan Facility, which had injected well over a trillion dollars into the credit markets. A few days later, the Federal Reserve Board announced that it was raising the rate of its Discount Window, the rate that the Federal Reserve charges institutions that borrow from it directly, from 0.5% to 0.75%. The target rate for the Federal Funds Rate, the rate created for interbank loans by open market operations of the Federal Reserve, will remain between 0.0% and 0.25% for an extended time. Thus the monetary aspect of the economic system has improved considerably but has not completely returned to normal.

Strikingly, a major measure of money in circulation, M-2, during the period of very lax monetary policy and stimulus spending actually did decline (see Exhibit DHC-17, p.3 of 3), rather than rise, despite all the money and credit being pumped into the economy. It may take some time before the economy becomes more normal. As noted in this testimony, two of the Federal Reserve regional bank presidents, the two who have expressed great concern about inflation, do not see inflation as an immediate threat. One possible reason for their sanguine attitude is high unemployment (see Exhibit DHC-17, pp.1-2 of 3). Rising salaries and wages are unlikely to be a source of inflation for some time. At the same time, the apparent recovery has moderated its pace. Economists had expected that the Fourth Quarter of 2009 would show annualized growth of 5.9%, but that rate has now been adjusted to 5.6% and succeeding quarters are now forecasted to grow above 3% until the second half of next year.

The LIBOR-OIS Spread as a Summary Indicator

Rajdeep Sengupta and Yu Man Tam

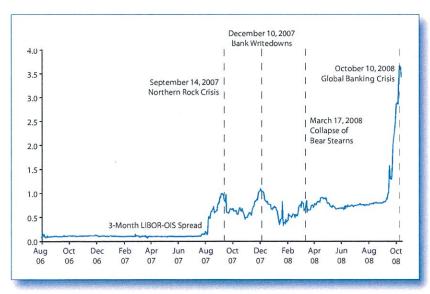

he LIBOR-OIS spread has been a closely watched barometer of distress in money markets for more than a year. The 3-month London Interbank Offered Rate (LIBOR) is the interest rate at which banks borrow unsecured funds from other banks in the London wholesale money market for a period of 3 months. Alternatively, if a bank enters into an overnight indexed swap (OIS), it is entitled to receive a fixed rate of interest on a notional amount called the OIS rate. In exchange, the bank agrees to pay a (compound) interest payment on the notional amount to be determined by a reference floating rate (in the United States, this is the effective federal funds rate) to the counterparty at maturity. For example, suppose the 3-month OIS rate is 2 percent. If the geometric average of the annualized effective federal funds rate for the 3month period is 1.91 percent, there will be a net cash inflow of \$2,250 on a principal amount of \$10 million [(2 percent -1.91 percent) \times 3/12 \times \$10 million = \$2,250 to the bank from its counterparty.

A bank borrowing at the 3-month LIBOR rate of 2.10 percent that enters into a swap to receive at the 3-month OIS rate of 2 percent has a borrowing cost equal to the effective federal funds rate plus 10 basis points. Entering into the OIS exposes the bank to future fluctuations in the

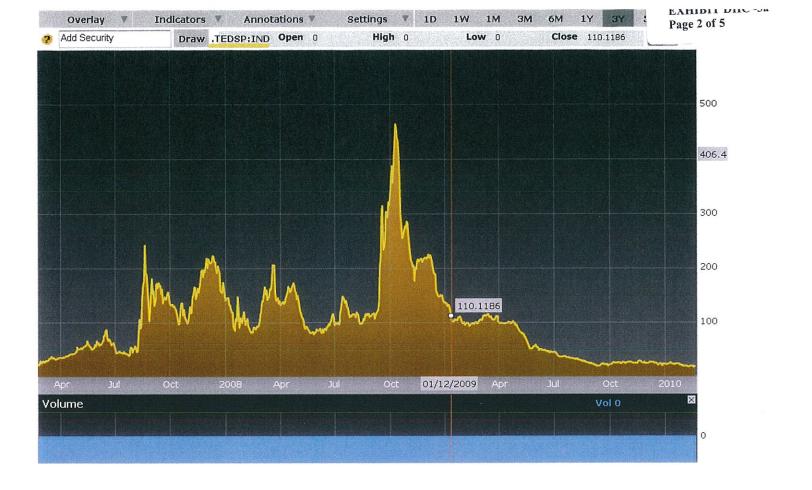

reference rate. However, the bank can guarantee itself longer-term funding while still paying close to the overnight rate. Because the alternative would be rolling over the funds on a daily basis at changing overnight rates, banks are willing to pay a premium. This is reflected in the LIBOR-OIS spread (defined as the difference between the LIBOR rate and the OIS rate) shown in the chart. In times of stress, the LIBOR, referencing a cash instrument, reflects both credit and liquidity risk, but the OIS has little exposure to default risk because these contracts do not involve any initial cash flows. The OIS rate is therefore an accurate measure of investor expectations of the effective federal funds rate (and hence the Fed's target) over the term of the swap, whereas LIBOR reflects credit risk and the expectation on future overnight rates.

Before the onset of the turmoil in the credit markets in August 2007, the LIBOR-OIS spread was around 10 basis points. However, in just over a month, the spread rose to 85 basis points on September 14, 2007, when the Bank of England announced emergency funding to rescue the troubled Northern Rock, one of the U.K.'s largest mortgage lenders. The spread reached its all-time high at 108 basis points on December 6, 2007. Around the same time, large investment banks such as UBS and Lehman Brothers announced huge write-downs. On March 17, 2008, the collapse of Bear Stearns led to an 83-basispoint spread, a 19-basis-point increase from the previous trading day. In the latest illiquidity wave following the failure of Lehman Brothers, the spread was 365 basis points (as of October 10, 2008). In short, the LIBOR-OIS spread has been the summary indicator showing the "illiquidity waves" that severely impaired money markets in 2007 and 2008.

¹ Liquidity risk is the risk that a bank could not convert its assets into cash, whereas credit risk is the risk that it could fail to meet its contractual obligations. Some have claimed that this distinction is unclear and that, particularly in the case of financial institutions, "the definition of liquidity is elusive." See von Thadden, Ernst-Ludwig. "Liquidity Creation Through Banks and Markets: Multiple Insurance and Limited Market Access." *European Economic Review*, April 1999, 43(4-6), pp. 991-1006.

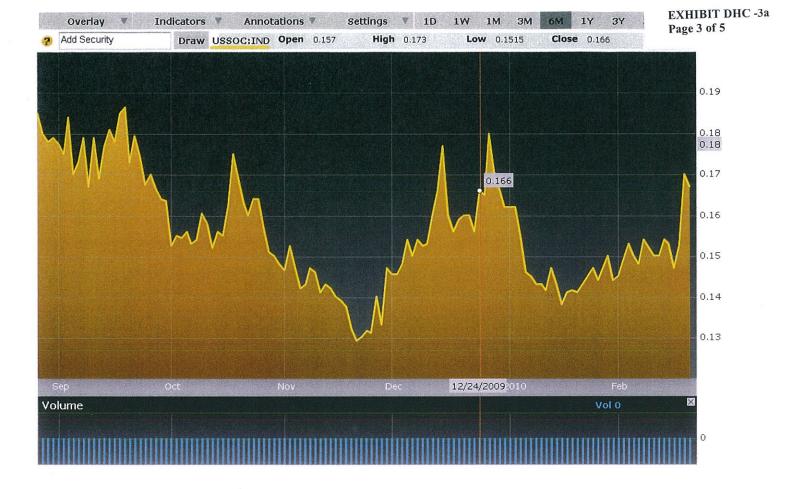

Views expressed do not necessarily reflect official positions of the Federal Reserve System.

Business Profile

BUSINESS: Artesian Resources Corporation, through its subsidiaries, engages in the distribution and sale of water to residential, commercial, industrial, governmental, municipal, and utility customers in the state of Delaware. It also provides water for public and private fire protection to customers in its service territories. In addition, the company offers wastewater services, as well as designs and constructs wastewater facilities and infrastructure. As of December 31, 2006, Artesian Resources had approximately 73,800 metered customers and served a population of approximately 243,000. As of the above date, it served customers through approximately 1,050 miles of transmission and distribution mains. Has 198 employees. Chairman, C.E.O. & President: Dian C. Taylor. Address: 664 Churchmans Rd., Newark, DE 19702. Tel.: 302 453-6900. Internet: http://www.artesianwater.com

Industry Commentary

The Water Utility Industry has not done too well over the last few months. Indeed, investor sentiment has remained weak for most in this group since our January review, as signs of a stabilizing economy, along with difficult operating conditions, caused many on Wall Street to look outside this space for better growth potential. Indeed, the majority of the companies here reported disappointing December-earnings results due to inclement weather and the rising costs of doing business.

Although weather conditions ought to take on more normal patterns this year, and there seems to a more favorable regulatory landscape in place, the group still faces a stiff headwind looking ahead. The Environmental Protection Agency suggests that most water infrastructures are insufficient and are in need of significant repair, if not replacement. In fact, data reveals that nearly half of the water pipes currently in place will be classified as inadequate by the end of the decade, requiring major investment. Unfortunately, most providers do not have the finances to meet these commitments and will be forced to seek outside financing to stay afloat. The Industry, therefore, ranks near the bottom of the *Value Line Investment Survey*, with growth being limited by greater maintenance costs and the expenses associated with doing so.

Positive Industry Fundamentals

No matter how you slice it, water is one of the biggest necessities of human existence. It is used in virtually every aspect of life, providing the ultimate in job security for those who ensure its safe and effective delivery to fountains and faucets in millions of homes across the United States. And demand is only expected to increase in years to come, with the population likely to continue to grow.

With so much riding on the delivery of water, individual states have put regulatory bodies in place to oversee water utilities, and maintain a balance of power between them and customers. They are responsible for reviewing and ruling on general rate requests made by utilities to help recover costs. Although many of these authorities have tended to be public advocates in the past, the tide has turned more recently, with a more

business-friendly approach being implemented of late. Indeed, general rate cases are coming back with more favorable rulings and in a far more-timely manner. The implementation of accounting mechanisms, such as those layed out in the Water Action Plan, should continue to benefit the industry and provide more predictable future results.

Troubling Costs

Despite the better regulatory environment, water providers have a difficult road ahead. Many of the current water systems were built decades ago and have grown outdated and require significant maintenance or complete overhauls. This, coupled with the growing threat of bioterrorism, ought to continue driving maintenance and infrastructure costs higher, forcing many cash-strapped companies to seek out financiers. Many smaller operations, meanwhile, unable to meet the capital requirements, are looking to get out. SouthWest Water, for example, has announced that it has accepted a buyout offer from a group of independent investors. As a result, it is likely nearing the end of its days in our Survey. This can be a boon to some of the larger players, such as Aqua America, which has used the consolidation trend as a way to build its business at a relatively low start-up cost. M&A activity ought to remain widespread.

Conclusion

Most investors will probably not want to dive into these waters. The majority of the stock's here lack appreciation potential for both the coming six to 12 months as well as the next 3 to 5 years. That said, *Aqua America* may pique the interest of some, as its aggressive acquisition strategy will help to drive industry-leading growth out to 2013-2015. Meanwhile, we believe that investors may have a bit of false sense of security with this group. Although these stock's healthy dividends have historically provided some shelter during times of economic uncertainty, increasing costs and a dearth of finances may eventually catch up with entities operating in this space, resulting in tempered income generation. Either way, there are better income vehicles to be found elsewhere. As always, though, we suggest that investors look through reports of each individual stock before making a financial commitment.

Andre J. Costanza

Forecasts for interest rates and the Federal Reserve's Major Currency Index represent averages for the quarter. Forecasts for Real GDP, GDP Price Index and Consumer Price Index are seasonally-adjusted annual rates of change (saar). Individual panel members' forecasts are on pages 4 through 9. Historical data for interest rates except LIBOR is from Federal Reserve Release (FRSR) H.15. LIBOR quotes available from The Wall Street Journal. Interest rate definitions are the same as those in FRSR H.15. Treasury yields are reported on a constant maturity basis. Historical data for the Fed' Major Currency Index is from FRSR H.10 and G.5. Historical data for Real GDP and GDP Chained Price Index are from the Bureau of Economic Analysis (BEA). Consumer Price Index (CPI) history is from the Department of Labor's Bureau of Labor Statistics (BLS). *Interest rate data for 10 2010 based on historical data through the week ended March 19th. Data for 10 2010 Major Currency Index also is based on data through week ended March 19th. Figures for 1Q 2010 Real GDP, GDP Chained Price Index and Consumer Price Index are consensus forecasts based on a special question asked of the panelists this month (see page 14).
